TECHNICAL SPECIFICATIONS & SUMMARY

[Terminal Connector] Description Generally designed for speakers, amplifiers, and music players, these terminals have multiple uses in applications requiring quick equipment interconnection as they come with push release and an Insert mechanism to easily interconnect two devices with the wires. The spring-loaded mechanism is very easy to use, when you want to connect the device, accomplish it just by pushing the lever down and insert the wire and when you want to release the existing wire then just bring that lever down again and now you can take out your wire and disconnect your device. This Terminal block or connector comes with easy to mount two through holes which allow the user to easily screw-mount it to any application area. It's mostly used where the devices are not in a fixed place or always in changing its place like in DJ shows or music events where the location of events keep on changing and thus the equipment/devices used also have to be mobile and need to be connected with such connectors which are easy to plug in and plug out whenever needed.
